Subject: Update on "90/10" role based open access

Hi Rene, Jorge, Peder,

Season's greeting! I hope you are well. I wanted to provide an update on progress with the "90/10" role based open access that you have helped enable!

Background:

As a quick recap, this model will provide open (zero request required) access to collections of AZ clinical study data, to user groups defined by role and org, under agreed terms that specify how the data can be used. The aim is to enable data access at scale, with zero friction nor time-delay, with reduced administration overhead for Data Owners, whist securing responsible data use.

Approach:

With Rene's support we devised two *Data Collections* that will be made accessible. In brief a data collection is a unit of access governance, here, comprising a set of studies where all associated data and modalities of data are included. To achieve this, Rene helped us to approve studies by general category, or individually as needed.
The two Data Collections are:

1) A Data Collection of closed and PTAP studies.
2) A Data Collection of ongoing studies (e.g., closed arms of ongoing studies; open label Ph1-2 studies). Presently, we focussed on approving the ctDNA priorities, but with Rene's support and review, this Data Collection can grow. The outcome of which is in a doc below.

The users who will gain access to these collections as a first tranche will be data scientists, data engineers and bioinformaticians in the ODSAI team (plus potentially a few named users who need to access ctDNA data from Leora's and Matt's teams).

Current status:

- This week, a small number of users are testing the connection to these data, reviewing the user-guidance material and providing feedback to help achieve a successful rollout.
- Next week, we plan to roll out to the full ODSAI user group.
- Ahead of that rollout, I wanted to provide the documents below for reference and any review or comment you wish to make.

Documents for your review and reference:

- General guidance document on the role-based open access approach. This is non-specific to Oncology data and ODSAI access, purely for your reference.
- Documents outlining the content of closed studies Data Collection and the Ongoing Studies Data Collection, alongside the outcome of the approvals that Rene provided.
    - @Iacona, Renee, there is nothing new in these documents that you have not already discussed and agreed with us, but I provide them for your reference and in case you wish to take a final review before we roll out next week. Please let me know if you have any further questions or concerns to address.
- Documents outlining the Agreement of Terms under which the ODSAI staff can access and use the closed studies data collection (here) and the Agreement of Terms under which the ODSAI staff can access the ongoing studies data collection (here).
    - @Reis-Filho, Jorge, all of this information is being communicated to the users by document and presentation, in active collaboration with Justin J's team, but I invite you to review the info and raise any key questions or concerns prior to rollout next week.

Next steps for improvement and increased impact:

- The greatest area of impact we are prioritising is to include more data into the collections. The first aspect of this is where we have been working with Rene's programming team to support identification and documentation of more datasets - this is an ongoing activity. The second is working with Rene to white-list more existing ongoing studies, where we will provide a fresh set of priorities according to the agreed categories to you before year end, for follow-up with you in the new year. Third, we have a meeting set in February, for review of the pipeline, to proactively white-list new study datasets according to pipeline progress - we will follow up on the format of that meeting in January.
- One area for increased impact in 2026, can be to include more user groups, as needed and appropriate. My team will pick this question up as a priority in the new year.
- We are actively working on additional tech-enablers to replace the documents above, support users in understanding what data they can access, and provide processes to include more data proactively under Data Owner approval.

Finally, I want to extend thanks to you all: Jorge, as his team under Justin J have been excellent partners in helping us plan our ODSAI rollout; and Rene for her significant time and support in devising the data collections and proactively white-listing studies for access!

If you wish to have a deeper dive, discussion or pose questions about any of the above, please don't hesitate to ask. I will be back in touch with further updates as relevant.

Many thanks,

Jamie MacPherson, PhD
